Modius Offers Integrated Solution for Dynamic Data Centers with HP Integrity NonStop Servers

Bridging data center operational gaps to protect business continuity.

SAN FRANCISCO, CA – November 18, 2009 – Modius, Inc. announced today its Modius OpenData® availability and performance monitoring software solution for comprehensive data center management will be available through HP. Aimed at operators and managers of mission-critical facilities, the solution offers comprehensive risk management, environmental monitoring, and performance measurement for all power and cooling equipment. The OpenData solution is the first system to protect uptime at all application layers while driving energy efficiency to new limits.

“Enterprise data centers need the same power chain visibility they have with their individual technology stacks,” said Craig Compiano, CEO of Modius. “The integration of the OpenData solution with HP’s highly-scalable and fault-tolerant server platform offers a comprehensive monitoring solution that generates a single, real-time view of business-critical facilities across the enterprise, including all major data centers, server rooms, and branch offices.”

In today’s dynamic data center environment, categorized by such trends as facility consolidation, server virtualization, and movement toward an IP-based infrastructure, data center operators are presented with significant power and cooling issues that severely disrupt business continuity. The Modius solution uniquely addresses these challenges through continuous measurement of all device performance data from an unlimited number of sites providing the most reliable alarms management, actionable analytics, and real-time metrics such as Power Usage Effectiveness (PUE) for proactive operations and sustainable energy cost improvements. With this reseller agreement, the solution will initially be available on HP Integrity NonStop servers, HP’s premier computing platform for highly-scalable and fault-tolerant data management.

“Customers today face data center challenges related to application uptime, risk management and capacity planning,” said Steve Saltwick, director of Vertical Solutions, Business Critical Systems, HP. “The combination of HP Integrity NonStop servers and Modius’ OpenData monitoring software allows customers to effectively manage these business issues and also improve energy efficiency, all resulting in a lower total cost of ownership.”
